(414) 688-0696 • mahika.mahapatra.1@gmail.com • linkedin.com/in/mahika-mahapatra-it • github.com/mahikamahapatra101
• Portfolio: mahikamahapatra101.github.io/Digital-Portfolio-v2

CS sophomore who ships. Built a production injury-risk tracker from 1,300+ real runs, and an LLM underwriting pipeline at CBRE. Comfortable taking projects from raw data to deployment.

EDUCATION

University of Wisconsin–Madison

Sep 2025 – May 2028 (Expected)

B.S. Computer Science | Dean's List, Spring 2026

Relevant coursework: Programming II & III / Data Structures (CS 300/400), Machine Organization & Programming (CS 354), Discrete Mathematics (CS 240), Linear Algebra (Math 340), Statistics (STAT 240), User Interfaces (CS 571)

Awards: FUSE Program: "In It To Win It" Award Winner MKE Tech Hub Coalition (2026), NCWIT Aspirations in Computing: State Winner 2025; State Honorable Mention(2022, 2023, 2024)

TECHNICAL SKILLS

Languages: Java, JavaScript, HTML/CSS, Bash, R, Python, SQL, LC3, C

Tools & frameworks: Git/GitHub, React, FastAPI, SQLAlchemy, pandas, JUnit 5, VS Code, Eclipse, n8n, Supabase, PostgreSQL, Google Gemini / AI Agents

EXPERIENCE & LEADERSHIP

CBRE & Project Destined — AI Engineering Fellow

June – Aug 2026

n8n · Google Gemini (AI Agent) · Lovable · Supabase · PostgreSQL | github.com/mahikamahapatra101/MultiGuard-AI

- Selected for an applied AI fellowship with CBRE, focused on LLM workflow automation and commercial real estate underwriting.
- Built an n8n and Google Gemini workflow to parse multifamily Offering Memorandums, extracting core financial metrics (NOI, cap rate, occupancy, debt yield) under strict schema constraints.
- Built a deterministic risk engine enforcing institutional investment thresholds (90% occupancy floor, 8% debt yield minimum) to flag covenant breaches and output Go/No-Go verdicts automatically.
- Connected a React frontend (built via Lovable) to a Supabase PostgreSQL database via secure webhooks to log deal audit trails and export PDF investment memos.

Ground Truth Cafe — UW–Madison | Barista

Jan 2026 – Present

- Handle high order volume and cash accuracy during peak campus rush while carrying a full CS courseload.

Science National Honor Society | Co-Founder, Sussex Hamilton High School

2024

- Founded the school's first-ever SNHS chapter: designed the application process, led a 6-month recruitment effort growing to 40+ members, and built all chapter programming with no existing template.

PROJECTS

RunLoad — Training Load & Injury-Risk Tracker

Jun – Jul 2026

Python · FastAPI · React · PostgreSQL · pandas | Full-Stack Web App | github.com/mahikamahapatra101/runload

- Built a full-stack app (FastAPI, React, SQLAlchemy, PostgreSQL) calculating Acute:Chronic Workload Ratio (ACWR) to flag a runner's training-load spikes before injury risk builds.
- Built a Python pipeline to clean and process 1,300+ real runs from a personal Strava export, adding a missing perceived-effort field and reconciling it against the rest of the dataset.
- Diagnosed a data-loss bug on Render (SQLite doesn't persist on the free tier, wiping run history on restart); migrated the backend to Postgres on Neon and deployed the app live on Render and Vercel.

ForecastGrid AI — Smart Grid Demand Forecasting

Jun 2026

R · LSTM Neural Network · Data Engineering · Time-Series Forecasting | FUSE Program, MKE Tech Hub Coalition | "In It To Win It" Award Winner

- Won the "In It To Win It" Award out of 6 competing teams at FUSE Demo Day, hosted by the MKE Tech Hub Coalition.
- Merged three misaligned datasets, commercial energy, residential consumption, and live Milwaukee weather feeds, writing custom alignment logic in R to fix mismatched timestamps breaking every join.
- Engineered features and trained an LSTM model to predict energy demand spikes one hour ahead, giving operators a real warning window instead of a real-time surprise.
- Flagged 165 high-risk demand hours out of 1,643 hours of real Milwaukee-area grid data and built a dashboard prototype so operators could act before a spike hit.

Stride — Campus Safety Navigation App

Mar 2026

Java · React · Dijkstra's Algorithm · Safety-Weighted Routing | CheeseHacks 24-Hour Hackathon | github.com/mahikamahapatra101/stride-cheesehacks

- Backend engineer on a 4-person team: implemented Dijkstra's pathfinding from scratch (priority queue, visited sets, path reconstruction) over a hand-mapped campus graph, weighted by lighting and foot traffic instead of raw distance.
- Reworked the edge weighting mid-build after the first version produced routes that didn't make sense, retuned multipliers under a 24-hour clock, and re-demoed a working version before time ran out.
- Built the backend API for the React front-end and a local routing fallback to keep the app operational if cloud API credits failed during the live demo.
